

# Sensitive Site Exploitation

21 June 2016

Sensitive Site Exploitation, in conjunction with SOFWERX, planned to conduct a broad topic discussion with industry, academia, and other Government activities regarding technology gaps which are estimated to be three to five years away from field-able technology. Unlike previous PM-SSE industry engagements, which generally focus on immediate or near-term solutions and often cover only a sub-set of SSE, this event will discuss the full spectrum of SSE and emphasize long term future requirements.

## Event Outcomes

- Create collisions between Industry, Academia, and Government, for the purpose of illuminating the long term needs of the Sensitive Site Exploitation Program.
- Approximately 25% of the attendees were non-traditional members, never previously working with USSOCOM.
- Topics included the entire spectrum of the SSE, including biometrics, forensic activities and explosive analysis.
- SOF end users contributed greatly to the discussion in helping the forum understand their unique perspectives and challenges.
